

Game Overview & Instructions

Phantoma · Unity 6 LTS · URP · Cinemachine 3 · single-player explorable build

What It Is

Phantoma is a single-player, character-driven explorable hub. You play an expressive chibi character wandering a lit low-poly city – streets, parks, trees, a clock tower, even drifting clouds. It's a place to *be* more than a place to beat: closer in spirit to PlayStation Home or a quiet MMO lobby than a combat game. The Final build opens on a title screen, drops you into the city, and lets you walk, sprint, jump, and inspect landmarks at your own pace.

How to Start

- Launch the executable (or open the Unity Play link on the [Source](#) page).
- On the title screen, press `Enter` / `Space` (or click) to begin.
- You spawn on a city street. Explore.

Controls

ACTION	INPUT
Move	<code>W A S D</code> / arrows / left stick
Look (orbit camera)	Mouse / right stick
Jump	<code>Space</code> / gamepad A
Sprint	<code>Shift</code> (hold) / L3 – drains the blue stamina arc
Interact	<code>E</code> / gamepad Y – when a landmark prompt appears
Free / lock cursor	<code>Esc</code>

Goal

There is no win condition. Progression is exploration and expression – jog the streets, find the landmarks (Notice Board, Bench, Street Sign, Clock Tower), read the little stories tucked into each, and enjoy a world tuned to feel calm and lived-in. The HUD shows HP, a stamina arc that responds to sprinting, online status, and level.

Source Code Breakdown – where my code is

All gameplay code is hand-written by me in C#, under `Assets/Scripts/` and `Assets/Editor/`. Unity-provided templates and packages (URP, Cinemachine, Input System, glTFast) are **not** counted. **681 total lines written by me** (529 lines excluding blanks and comments):

FILE	WHAT IT DOES	LINES
<code>Scripts/PlayerController.cs</code>	Camera-relative movement, walk/sprint, jump, gravity, animator Speed	125
<code>Scripts/PlayerInteractor.cs</code>	Nearest-landmark detection, "Press E" prompt + message HUD	115
<code>Scripts/OrbitCameraRig.cs</code>	Mouse/stick orbit rig that drives the Cinemachine third-person camera	88
<code>Scripts/HUDController.cs</code>	Stamina arc drain/regen on sprint, glow pulse	74
<code>Scripts/StartMenu.cs</code>	Title screen: pulse prompt, load the hub on Enter/Space/click	49
<code>Scripts/Interactable.cs</code>	Landmark data (prompt, title, flavor message) + interact hook	29
<code>Editor/LocomotionAutoAssign.cs</code>	Editor tool: auto-imports walk/run/jog FBX as humanoid + looped + in-place and rebuilds the locomotion blend tree	201
Total		681

The full source and both desktop builds are linked on the [Source](#) page, along with the in-browser Unity Play build.

Enhanced from the Phase 1 draft: controls now match the shipped build, and the code breakdown reflects the real scripts and a verified 681-line count (up from the draft's estimated 340).
